Open Stance Milestone 1 Video Script

About 5 minutes, about 600 spoken words. Saved/Clips/M1_Video_Silent.mp4 is the whole video already cut to these times (5:00, silent): record the voice over it, reading each row when its time comes. The separate clips are there if you want to re-cut a section.

Clips

All in Saved/Clips (1920 x 1080, 30 fps, no audio). Recorded from the running game, not edited.

Clip	Length	Shows
01_greybox_proof.mp4	30 s	Match camera, half speed. The scripted proof with stage captions and debug bars; ends on Results 16–0.
02_proof_side_hitboxes.mp4	26 s	The same proof side-on at half speed, with hitboxes, target zones and limb traces.
03_techniques_side.mp4	22 s	All eight techniques, side-on, hitboxes on. Thrown from the starting distance, so every one misses.
04_techniques_behind.mp4	22 s	All eight techniques from the play camera, with the debug overlay (each reads MISS).
05_menu_flow.mp4	18 s	Title, Main, Sparring, Side Select, Fighter Select, Controls.
06_arena_cameras.mp4	12 s	Competition arena from four camera presets, one technique each.
07_code_skill_stick.mp4	12 s	Rider: the Skill Stick gesture table (OpenStanceSkillStick.cpp).
08_code_state_machine.mp4	12 s	Rider: IsLegalTransition (OpenStanceCombatMachine.cpp).
09_code_hit_trace.mp4	12 s	Rider: the hit-trace range check (OpenStanceHit.cpp).
10_mocap_marker_check.mp4	13 s	Mocap lab: suited up, marker placement being checked.
11_mocap_capture_volume.mp4	18 s	Mocap lab: movement and footwork in the capture volume.
12_mocap_photos.mp4	16 s	Photos, 4 s each: full marker set, markers in Vicon Nexus, test kick, dojang.
13_dojang_reference_kicks.mp4	20 s	Dojang reference: two chambered kicks toward the camera.

Script

Time	On Screen	Say
0:00 – 0:15	**05_menu_flow.mp4** Title screen, held	Hi, I'm Joey, and this is Open Stance: Gyeorugi, a taekwondo sparring game. Milestone 1 asked one question: can you throw real kicks with the right stick, and have them score like a real match?
0:15 – 0:24	**01_greybox_proof.mp4** Half speed. Side kick 2, roundhouse 4, spin side kick 8, back-leg roundhouse 10	This is my proof run, all real stick input. Side kick, roundhouse, a spinning side kick for four, then a back-leg roundhouse.
0:24 – 0:32	**01_greybox_proof.mp4** Steps back, side kick misses; closes in, spin side kick to the head, 16	Now I step back and kick from too far. It misses, no points. Step in, spinning kick to the head: six.
0:32 – 0:45	**01_greybox_proof.mp4** Results 16–0, held	Sixteen to nothing. In taekwondo a twelve-point lead ends the match early, so it stops right there. Real techniques, scored the real way.
0:45 – 1:05	**03_techniques_side.mp4** First 20 s. One technique every 2.5 s, in the order named; all thrown from the starting distance, so all miss	Here are the eight techniques from the side: side kick, roundhouse, hook, axe, punch, spinning side kick, spinning hook and tornado. They're thrown from the starting distance, so none of them land. This is just to show each one.
1:05 – 1:25	**07_code_skill_stick.mp4** Rider, holds on the last frame	Every technique is a path on the right stick, the Skill Stick. Instead of writing them as left and right, I wrote them toward or away from the kicking leg. So when your stance switches, the same flick still throws the same kick. That's how a real fighter thinks about it.
1:25 – 1:45	**04_techniques_behind.mp4** First 20 s. Same eight from the play camera; the overlay on the left reads MISS each time	This is the camera you'd actually play from, with my debug overlay on the left. It shows your stance, which leg kicked, the move and the result. Here every one says miss. When a kick doesn't score, the overlay tells me why, so I'm not guessing.
1:45 – 2:05	**08_code_state_machine.mp4** Rider, holds on the last frame	This is the state machine that decides what you can do. Every kick has a startup, an active phase and a recovery. Hold the left bumper and you can pull a kick before it's active. That's a fake. But you can't cancel the recovery, so a miss gets punished.

Time	On Screen	Say
2:05 – 2:14	**02_proof_side_hitboxes.mp4** The proof again, side-on, half speed, hitboxes on. First four kicks score	Same run side-on, with the hitboxes on. Orange is the chest protector, yellow is the head. Kicks only score through those.
2:14 – 2:22	**02_proof_side_hitboxes.mp4** Steps back, the miss, then the head kick	When I step back, the foot never reaches the orange, so nothing. Then the head kick goes through the yellow.
2:22 – 2:30	**02_proof_side_hitboxes.mp4** Results 16–0, held	The animations are placeholders for now, but the hitboxes and the scoring are the real system.
2:30 – 2:50	**09_code_hit_trace.mp4** Rider, holds on the last frame	This is the hit check. Before it looks for contact, it checks range, and that range scales with the fighter's height, so a taller fighter really does reach further. That's what threw out the kick from too far, before contact was even tested.
2:50 – 3:10	**05_menu_flow.mp4** Full clip: Title, Main, Sparring Setup, Choose Your Side, Fighter Select, Controls	The menus are all built in C++, from the prototype in my design document. Main menu, sparring setup, choosing your side, Chung in blue or Hong in red, fighter select, and the full controls screen.
3:10 – 3:20	**06_arena_cameras.mp4** First 10 s: the competition arena from several camera presets	And here's the competition arena, from a few of the camera presets.
3:20 – 3:45	**01_greybox_proof.mp4** Results screen, held	Progress-wise, all eight Milestone 1 issues are closed. I tested the overlay on a real controller, and the last rules and scope decisions are now in the design document. The combat code has 53 automated tests, so every change I make gets checked against the rules.
3:45 – 4:00	**10_mocap_marker_check.mp4** Full clip: suited up, markers checked, T-pose	One thing changed from the plan: motion capture moved to Milestone 2, so everything you've seen uses placeholder animation. But I've already done a first session in the BCIT motion capture lab.
4:00 – 4:15	**12_mocap_photos.mp4** First 15 s, 4 s each: marker set, Vicon Nexus, test kick, dojang	That's me with the full marker set. Here are the markers in Vicon Nexus, a test kick, and my dojang.
4:15 – 4:30	**11_mocap_capture_volume.mp4** First 15 s: moving in the capture volume	This is me moving in the capture volume. Each dot on the screen is a reflective marker, and the cameras track them to rebuild the movement.

Time	On Screen	Say
4:30 – 4:45	**13_dojang_reference_kicks.mp4** First 15 s	And this is reference I filmed at the dojang with my mocap actor, so we know exactly what to perform in the capture session.
4:45 – 5:00	**06_arena_cameras.mp4** Fades out at the end	Milestone 2 is a full match you can play against a friend, with the first captured kick in the game. Thanks for watching.

Rubric Check

- **Progress: the proof run and the issue count (8 of 8 closed) at 3:20; the mocap change to Milestone 2 at 3:45.**
- **Technical detail:** three code snippets recorded in Rider, each with why it was needed and what it does; the repository is on GitHub (code) and Perforce (full project).
- **Presentation:** every point sits on a clip of the running game, with hitboxes and the debug overlay showing the systems at work.
- **Optional extra:** a short recording of DT_MoveData open in the Unreal editor would show the data table directly.
